

Currently, 76 percent of U.S. hospitals connect with patients and consulting practitioners at a distance through the use of video and other technology.

**Telehealth helps hospitals get more patients, which means higher patient satisfaction, increased revenue, and reducing the impact of the physician shortage.**

How?

### **Saving Time For Both Providers And Their Patients**

- Providers in underserved locations can serve more people
- Patients can save time by not traveling to a hospital
- Reducing the number of patients who don't show up to appointments
- More flexibility in hours and providers could help their patients at later hours

### **Reducing Readmissions**

If a patient has been discharged, they can have more frequent check-in appointments from home and allowing providers to monitor patients more closely and lower the risk of readmission.

### **Relieving ERs**

- Patients can get medical attention for non-urgent matters from home instead of going to the ER and ER Doctors can focus on critical patients.
- Telehealth could reduce ER visits by 27% in aging adults.

### **Conducting Clinical Trials**

Allows for people to participate in trials from outside the hospitals' region, which could propel medical research forward.

### **Psychiatric Help**

Patients who struggle with mental illness can get help from the safety of their home.
